

A Terminating q -Lauricella Transformation Formula

Benjamin Morris

June 7, 2023

The purpose of this note is to give a self contained discussion and proof of a charming q -series identity discovered in a previous project of mine. We first introduce some basic notation. We will use the standard notation for the finite q -Pochhammer symbol

$$(x; q)_m = \begin{cases} (1-x)(1-qx)\dots(1-q^{m-1}x), & m > 0, \\ 1, & m = 0, \\ [(1-q^{-1}x)(1-q^{-2}x)\dots(1-q^m x)]^{-1}, & m < 0, \end{cases} \quad (1)$$

aswell as the infinite q -Pochhammer symbol which is defined whenever $|q| < 1$

$$(x; q)_\infty = \prod_{n=0}^{\infty} (1 - q^n x). \quad (2)$$

Notice that formulas (1) and (2) can be zero or singular when x is an integer power of q . Such cases require additional care as we will see. In this note we freely use identities for $(x; q)_n$ and $(x; q)_\infty$ from [2] Appendix I, and we will adopt the implicit base convention $(x)_n = (x; q)_n$ and $(x)_\infty = (x; q)_\infty$.

We can now state the main result:

Proposition 1. *Fix any integer $n \geq 1$ and non-negative integer tuples $\mathbf{k} = (k_0, k_1, \dots, k_n) \in \mathbb{N}^{n+1}$, $\mathbf{l} = (l_1, \dots, l_n) \in \mathbb{N}^n$, and $\mathbf{m} = (m_1, \dots, m_{n-1}) \in \mathbb{N}^{n-1}$. Denote $k = \sum_{j=0}^n k_j$, $l = \sum_{j=1}^n l_j$, and $m = \sum_{j=1}^{n-1} m_j$. Then for a complex number q with $0 < |q| < 1$, and arbitrary complex parameters y , and z , we have the following equality:*

$$\begin{aligned} & \frac{(y)_{l+m}}{(yz)_{l+m}} \sum_{\lambda \in \mathbb{N}^n} \sum_{\mu \in \mathbb{N}^{n-1}} \left[\frac{(z)_{\lambda+\mu} \prod_{j=1}^n (q^{-l_j})_{\lambda_j} \prod_{j=1}^{n-1} (q^{-m_j})_{\mu_j}}{(q^{1-l-m}/y)_{\lambda+\mu} \prod_{j=1}^n (q)_{\lambda_j} \prod_{j=1}^{n-1} (q)_{\mu_j}} \right. \\ & \quad \left. \times q^{\sum_{j=1}^n \lambda_j (1+k_j + \sum_{a=1}^{j-1} (k_a - (l_a + m_a))) + \sum_{j=1}^{n-1} \mu_j (1 + \sum_{a=1}^j (k_a - (l_a + m_a)) + m_j)} \right] \\ & = z^{k_0} \frac{(y)_k}{(yz)_k} \sum_{\kappa \in \mathbb{N}^{n+1}} \left[\frac{(z)_\kappa \prod_{j=0}^n (q^{-k_j})_{\kappa_j}}{(q^{1-k}/y)_\kappa \prod_{j=0}^n (q)_{\kappa_j}} (q^{1+k_0-k}/(yz))^{\kappa_0} q^{\sum_{j=1}^n \kappa_j (1+k_j - \sum_{a=j}^n (k_a - (l_a + m_a)))} \right], \quad (3) \end{aligned}$$

where we adopt the same labelling convention $\kappa = (\kappa_0, \kappa_1, \dots, \kappa_n)$ for components of κ as per \mathbf{k} . We also use the shorthand $\kappa = \sum_{j=0}^n \kappa_j$, $\lambda = \sum_{j=1}^n \lambda_j$ and $\mu = \sum_{j=1}^{n-1} \mu_j$, as well as the convention $m_n = 0$ wherever it appears.

We will not give the proof of [proposition 1](#) yet, however, we can immediately note that both sides are finite sums in light of the $(q^{-a})_\alpha$ terms in the numerators which vanish for $\alpha > a$. We choose to write infinite sums to make explicit the connection with q -Lauricella series. To do so succinctly, we define two auxilliary n -tuples of integers $\mathbf{r} = (r_j)$ and $\mathbf{p} = (p_j)$ by

$$r_j = 1 + \sum_{a=1}^j (k_a - (l_a + m_a)), \quad p_j = 1 - \sum_{a=j}^n (k_a - (l_a + m_a)), \quad (4)$$

for $j = 1, \dots, n$ (taking $m_n = 0$ as before). Let us also denote by $\hat{\mathbf{r}}$ the $(n-1)$ -tuple (r_1, \dots, r_{n-1}) , and by $\tilde{\mathbf{k}}$ the $(n-1)$ -tuple (k_1, \dots, k_n) for convenience.

Now introduce the type D , q -Lauricella series treated in [1]

$$\Phi_D^{(n)}[\beta; \alpha_1, \dots, \alpha_n; \gamma; q; x_1, \dots, x_n] = \sum_{\nu_1=0}^{\infty} \dots \sum_{\nu_n=0}^{\infty} \frac{(\beta)_{\nu} (\alpha_1)_{\nu_1} \dots (\alpha_n)_{\nu_n}}{(\gamma)_{\nu} (q)_{\nu_1} \dots (q)_{\nu_n}} x_1^{\nu_1} \dots x_n^{\nu_n}, \quad (5)$$

where as before we use the notation $\nu = \sum_{j=1}^n \nu_j$. Using (4), and (5), the equality (3) is written succinctly as $\Theta_{\mathbf{k}, \mathbf{l}, \mathbf{m}} = \Omega_{\mathbf{k}, \mathbf{l}, \mathbf{m}}$, where

$$\Theta_{\mathbf{k}, \mathbf{l}, \mathbf{m}} = \frac{(y)_{l+m}}{(yz)_{l+m}} \Phi_D^{(2n-1)} \left[z; q^{-l}, q^{-m}; q^{1-l-m}/y; q; q^{r+l+(m,0)}, q^{\hat{\mathbf{r}}+\mathbf{m}} \right], \quad (6)$$

is the left hand side, and

$$\Omega_{\mathbf{k}, \mathbf{l}, \mathbf{m}} = z^{k_0} \frac{(y)_k}{(yz)_k} \Phi_D^{(n+1)} \left[z; q^{-k}; q^{1-k}/y; q; q^{1+k_0-k}/(yz), q^{\mathbf{p}+\tilde{\mathbf{k}}} \right], \quad (7)$$

is the right hand side. Here we are using element-wise exponentiation short hand $q^{\mathbf{x}} = (q^{x_1}, \dots, q^{x_m})$.

A standard procedure for dealing with expressions such as (6) and (7) may be to use (4.1) from [1] to rewrite them in terms of ${}_{m+1}\phi_m$ basic hypergeometric functions (See [2] (1.2.22)) and work with known transformation formulae thereof. This approach is not valid here. For example, applying (4.1) [1] to (6) yields

$$\Theta_{\mathbf{k}, \mathbf{l}, \mathbf{m}} \propto {}_{2n}\phi_{2n-1} \left[\frac{q^{1-l-m}/(yz), q^{r+l+(m,0)}, q^{\hat{\mathbf{r}}+\mathbf{m}}}{q^{r_1+m_1}, \dots, q^{r_{n-1}+m_{n-1}}, q^{r_n}, q^{r_1}, \dots, q^{r_{n-1}}; q, z} \right], \quad (8)$$

which contains denominator arguments of the form q^a with a potentially a negative integer. In this case the ${}_{m+1}\phi_m$ function is undefined and a similar problem occurs with the RHS (7).

Fortunately we do not need the transformation rule (4.1) from [1]; we can settle for the intermediate step

$$\Phi_D^{(n)}[\beta; \alpha; \gamma; q; \mathbf{x}] = \frac{(\beta)_{\infty}}{(\gamma)_{\infty}} \sum_{a=0}^{\infty} \frac{(\gamma/\beta)_a}{(q)_a} \beta^a \prod_{j=1}^n \left(\sum_{\nu_j=1}^{\infty} \frac{(\alpha_j)_{\nu_j}}{(q)_{\nu_j}} (x_j q^a)^{\nu_j} \right). \quad (9)$$

In [1] the bracketed sums are evaluated using the infinite summation identity for ${}_1\phi_0[\alpha; q; x]$ (II.3) [2], however, in our case these sums are terminating since α_j is always a negative integer power of q . We therefore apply the finite summation identity (II.4) [2]

$${}_1\phi_0[q^{-m}; q; x] = \sum_{n=0}^{\infty} \frac{(q^{-m})_n}{(q)_n} x^n = (xq^{-m})_m. \quad (10)$$

Combining formulae (9) and (10) we obtain

$$\begin{aligned} \Theta_{\mathbf{k}, \mathbf{l}, \mathbf{m}} &= \frac{(y)_{l+m}}{(yz)_{l+m}} \frac{(z)_{\infty}}{(q^{1-l-m}/y)_{\infty}} \sum_{\lambda=0}^{\infty} \frac{(q^{1-l-m}/(yz))_{\lambda}}{(q)_{\lambda}} (q^{r_n+\lambda})_{l_n} z^{\lambda} \prod_{j=1}^{n-1} (q^{r_j+m_j+\lambda})_{l_j} (q^{r_j+\lambda})_{m_j} \\ &= \frac{(z)_{\infty}}{(q/y)_{\infty}} \frac{(y)_{l+m}}{(yz)_{l+m}} \left(\frac{(q^{1-l-m}/(yz))_{l+m}}{(q^{1-l-m}/y)_{l+m}} z^{l+m} \right) \sum_{\lambda=0}^{\infty} \frac{(q/(yz))_{\lambda-l-m}}{(q)_{\lambda}} \left(\prod_{j=1}^n (q^{r_j+\lambda})_{l_j+m_j} \right) z^{\lambda-l-m} \\ &= \frac{(z)_{\infty}}{(q/y)_{\infty}} \sum_{\lambda=0}^{\infty} \frac{(q/(yz))_{\lambda-l-m}}{(q)_{\lambda}} \left(\prod_{j=1}^n (q^{r_j+\lambda})_{l_j+m_j} \right) z^{\lambda-l-m}, \end{aligned} \quad (11)$$

for the LHS, where again we understand $m_n = 0$, and

$$\begin{aligned}
\Omega_{\mathbf{k}, \mathbf{l}, \mathbf{m}} &= z^{k_0} \frac{(y)_k}{(yz)_k} \frac{(z)_\infty}{(q^{1-k}/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q^{1-k}/(yz))_\kappa}{(q)_\kappa} (q^{1+\kappa-k}/(yz))_{k_0} \left(\prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^\kappa \\
&= \left(z^{k_0} \frac{(yq^{k-k_0})_{k_0}}{(yzq^{k-k_0})_{k_0}} \frac{(q^{1-k}/(yz))_{k_0}}{(q^{1-k}/(y))_{k_0}} \right) \frac{(y)_{k-k_0}}{(yz)_{k-k_0}} \frac{(z)_\infty}{(q^{1-(k-k_0)}/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q^{1-(k-k_0)}/(yz))_\kappa}{(q)_\kappa} \left(\prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^\kappa \\
&= \frac{(y)_{k-k_0}}{(yz)_{k-k_0}} \left(\frac{(q^{1-(k-k_0)}/(yz))_{k-k_0}}{(q^{1-(k-k_0)}/(y))_{k-k_0}} z^{k-k_0} \right) \frac{(z)_\infty}{(q/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q/(yz))_{\kappa-(k-k_0)}}{(q)_\kappa} \left(\prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^{\kappa-(k-k_0)} \\
&= \frac{(z)_\infty}{(q/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q/(yz))_{\kappa-(k-k_0)}}{(q)_\kappa} \left(\prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^{\kappa-(k-k_0)}, \tag{12}
\end{aligned}$$

for the RHS. It follows from these expressions that both $\Theta_{\mathbf{k}, \mathbf{l}, \mathbf{m}}$ and $\Omega_{\mathbf{k}, \mathbf{l}, \mathbf{m}}$ are independent of k_0 , and depend on l_i and m_i , only via the combinations $l_i + m_i$. Both of these facts are necessary for [proposition 1](#) to hold. By cancelling the prefactors in (11) and (12), and relabelling $l_i + m_i \mapsto l_i$ for $i = 1, \dots, n-1$, $k - k_0 \mapsto k = \sum_{j=1}^n k_j$ and $q/(yz) \mapsto y$, to better reflect the dependence, we have reduced the equality $\Theta_{\mathbf{k}, \mathbf{l}, \mathbf{m}} = \Omega_{\mathbf{k}, \mathbf{l}, \mathbf{m}}$ to the following claim.

Proposition 2. *For any integer $n \geq 1$, complex parameter q , such that $0 < |q| < 1$, arbitrary complex parameters y and z , and non-negative integer tuples $\mathbf{l} = (l_j) \in \mathbb{Z}_{\geq 0}^n$ and $\mathbf{k} = (k_j) \in \mathbb{Z}_{\geq 0}^n$ ($j = 1, \dots, n$), we have the following equality*

$$\sum_{\lambda=0}^{\infty} \frac{(y)_{\lambda-l}}{(q)_\lambda} (q^{r_1+\lambda})_{l_1} \dots (q^{r_n+\lambda})_{l_n} z^{\lambda-l} = \sum_{\kappa=0}^{\infty} \frac{(y)_{\kappa-k}}{(q)_\kappa} (q^{p_1+\kappa})_{k_1} \dots (q^{p_n+\kappa})_{k_n} z^{\kappa-k}, \tag{13}$$

where $k = \sum_{j=1}^n k_j$, $l = \sum_{j=1}^n l_j$, and p_j and r_j are as per (4) (with $(l_a + m_a) \mapsto l_a$).

The proof of [proposition 2](#) requires two technical lemmas.

Lemma 1. *With $\mathbf{k}, \mathbf{l}, k, l$, and p_j as per [proposition 2](#), suppose that $k \geq l$ and define $\Delta = k - l \geq 0$. Then for any integer $0 \leq \kappa \leq \Delta - 1$ we have*

$$(q^{p_1+\kappa})_{k_1} \dots (q^{p_n+\kappa})_{k_n} = 0. \tag{14}$$

Proof. It suffices to show that for any $0 \leq \kappa \leq \Delta - 1$, there exists j such that $p_j + \kappa \leq 0$ and $p_j + \kappa + k_j > 0$, that is, $\{0, 1, \dots, \Delta - 1\} \subset U$ where $U = \bigcup_{j=1}^n (-(p_j + k_j), -p_j]$. Since $-(p_j + k_j) = -(p_{j+1} + l_j) \leq -p_{j+1}$ (for $j = 1, \dots, n-1$), it follows that U is an overlapping union of intervals giving

$$U = \left(\min_{j=1}^n (-(p_j + k_j)), \max_{j=1}^n (-p_j) \right] := (m, p].$$

Now note that $p \geq -p_1 = \Delta - 1$ and $m \leq -(p_n + k_n) = -(1 + l_n) < 0$ so we are done. \square

Lemma 2. *With $\mathbf{k}, \mathbf{l}, k, l$, and r_j as per [proposition 2](#), suppose that $k \geq l$ and define $\Delta = k - l \geq 0$. Then for any integer $\lambda \geq 0$ we have*

$$(q^{r_1+\lambda})_{k_2} \dots (q^{r_{n-1}+\lambda})_{k_n} = 0, \quad \Leftrightarrow \quad (q^{r_1+\lambda})_{l_1} \dots (q^{r_{n-1}+\lambda})_{l_{n-1}} = 0, \quad \Leftrightarrow \quad \lambda \leq r := \max_{j=1}^{n-1} (-r_j). \tag{15}$$

Furthermore, for any integer $\lambda > r$ we have

$$\frac{(q^{1+\lambda})_{k_1} (q^{r_1+\lambda})_{k_2} \dots (q^{r_{n-1}+\lambda})_{k_n}}{(q^{r_1+\lambda})_{l_1} \dots (q^{r_n+\lambda})_{l_n}} = \frac{(q)_{\lambda+\Delta}}{(q)_\lambda} \tag{16}$$

Proof. For the first claim define $K_0 = \{\lambda \in \mathbb{Z}_{\geq 0} \mid (q^{r_1+\lambda})_{k_2} \dots (q^{r_{n-1}+\lambda})_{k_n} = 0\}$ and similarly define $L_0 = \{\lambda \in \mathbb{Z}_{\geq 0} \mid (q^{r_1+\lambda})_{l_1} \dots (q^{r_{n-1}+\lambda})_{l_{n-1}} = 0\}$. Clearly $\lambda \in K_0$, if and only if there is some $1 \leq j \leq n-1$ such that $k_{j+1} > -(r_j + \lambda) \geq 0$, giving $L_0 = \left(\bigcup_{j=1}^{n-1} (-(r_j + k_{j+1}), -r_j] \right) \cap \mathbb{Z}_{\geq 0}$. Similarly, one can find that $L_0 = \left(\bigcup_{j=1}^{n-1} (-(r_j + l_j), -r_j] \right) \cap \mathbb{Z}_{\geq 0}$. These unions of intervals are overlapping since $-(r_j + k_{j+1}) = -(r_{j+1} + l_{j+1}) \leq -r_{j+1}$ and $-(r_j + l_j) = -(r_{j-1} + k_j) \leq -r_{j-1}$, for $j = 1, \dots, n-2$ and $j = 2, \dots, n-1$ respectively, therefore

$$\begin{aligned} \bigcup_{j=1}^{n-1} (-(r_j + k_{j+1}), -r_j] &= \left(\min_{j=1}^{n-1} (-(r_j + k_{j+1})), \max_{j=1}^{n-1} (-r_j) \right] := (m_1, r], \\ \bigcup_{j=1}^{n-1} (-(r_j + l_j), -r_j] &= \left(\min_{j=1}^{n-1} (-(r_j + l_j)), \max_{j=1}^{n-1} (-r_j) \right] := (m_2, r]. \end{aligned}$$

Now the fact that $m_1 \leq -(r_{n-1} + k_n) = -(1 + \Delta + l_n) < 0$, and $m_2 \leq -(r_1 + l_1) = -(1 + k_1) < 0$, gives $K_0 = \{0, 1, \dots, r\} = L_0$, which proves the first claim.

For the second claim, we now know that $\lambda > r$ means that $\frac{(q^{r_j+\lambda})_{k_{j+1}}}{(q^{r_j+\lambda})_{l_j}} = (q^{r_j+l_j+\lambda})_{k_{j+1}-l_j}$ is non-zero and non-singular. Therefore, (16) becomes

$$\begin{aligned} & (q^{1+\lambda})_{k_1} (q^{r_1+l_1+\lambda})_{k_2-l_1} \dots (q^{r_{n-1}+l_{n-1}+\lambda})_{k_n-l_{n-1}} [(q^{1+\Delta+\lambda})_{l_n}]^{-1} \\ &= (q^{1+\lambda})_{k_1+k_2-l_1} (q^{r_2+l_2+\lambda})_{k_3-l_2} \dots (q^{r_{n-1}+l_{n-1}+\lambda})_{k_n-l_{n-1}} [(q^{1+\Delta+\lambda})_{l_n}]^{-1} \\ &\vdots \\ &= (q^{1+\lambda})_{\Delta+l_n} [(q^{1+\Delta+\lambda})_{l_n}]^{-1} = (q^{1+\lambda})_{\Delta} = (q)_{\Delta+\lambda} [(q)_{\lambda}]^{-1}, \end{aligned}$$

as desired, where we iterate the rule $r_j + l_j = 1 + k_1 + \sum_{a=1}^{j-1} (k_{a+1} - l_a)$ to collapse the product. \square

Now we can prove [proposition 2](#) and hence [proposition 1](#).

Proof of Proposition 2. Since $(k_j, l_j) \mapsto (l_{n+1-j}, k_{n+1-j})$ is a symmetry of (13) we can assume WLOG that $k \geq l$ and define $\Delta = k - l \geq 0$. By [lemma 1](#) we can shift the summation of the RHS of (13) to $\kappa \mapsto \lambda + \Delta$ with $\lambda \geq 0$. Making use of the relations $p_{j+1} + \Delta = r_j$ for $j = 1, \dots, n-1$, and $p_1 = 1 - M$, we have

$$\begin{aligned} \sum_{\kappa=0}^{\infty} \frac{(y)_{\kappa-k}}{(q)_{\kappa}} (q^{p_1+\kappa})_{k_1} \dots (q^{p_n+\kappa})_{k_n} z^{\kappa-k} &= \sum_{\lambda=0}^{\infty} \frac{(y)_{\lambda-l}}{(q)_{\lambda+\Delta}} (q^{1+\lambda})_{k_1} (q^{p_1+\lambda})_{k_2} \dots (q^{p_{n-1}+\lambda})_{k_n} z^{\lambda-l} \\ &= \sum_{\lambda=0}^{\infty} \frac{(y)_{\lambda-l}}{(q)_{\lambda}} (q^{r_1+\lambda})_{l_1} \dots (q^{r_n+\lambda})_{l_n} z^{\lambda-l}, \end{aligned} \tag{17}$$

where the last equality follows from [lemma 2](#). \square
