## A Terminating q-Lauricella Transformation Formula

## Benjamin Morris

June 8, 2023

The purpose of this note is to give a self contained discussion and proof of a charming q-series identity discovered in a previous project of mine. We first introduce some basic notation. We will use the standard notation for the finite q-Pochhammer symbol

$$(x;q)_m = \begin{cases} (1-x)(1-qx)\dots(1-q^{m-1}x), & m>0,\\ 1, & m=0,\\ \left[(1-q^{-1}x)(1-q^{-2}x)\dots(1-q^mx)\right]^{-1}, & m<0, \end{cases}$$
(1)

as well as the infinite q-Pochhammer symbol which is defined whenever |q| < 1

$$(x;q)_{\infty} = \prod_{n=0}^{\infty} (1 - q^n x).$$
 (2)

Notice that formulas (1) and (2) can be zero or singular when x is an integer power of q. Such cases require additional care as we will see. In this note we freely use identities for  $(x;q)_n$  and  $(x;q)_\infty$  from [2] Appendix I, and we will adopt the implicit base convention  $(x)_n = (x;q)_n$  and  $(x)_\infty = (x;q)_\infty$ .

We can now state the main result:

**Proposition 1.** Fix any integer  $n \ge 1$  and non-negative integer tuples  $\mathbf{k} = (k_0, k_1, \dots, k_n) \in \mathbb{N}^{n+1}, \mathbf{l} = (l_1, \dots, l_n) \in \mathbb{N}^n$ , and  $\mathbf{m} = (m_1, \dots, m_{n-1}) \in \mathbb{N}^{n-1}$ . Denote  $k = \sum_{j=0}^n k_j$ ,  $l = \sum_{j=1}^n l_j$ , and  $m = \sum_{j=1}^{n-1} m_j$ . Then for a complex number q with 0 < |q| < 1, and arbitrary complex parameters y, and z, we have the following equality:

$$\frac{(y)_{l+m}}{(yz)_{l+m}} \sum_{\lambda \in \mathbb{N}^n} \sum_{\mu \in \mathbb{N}^{n-1}} \left[ \frac{(z)_{\lambda+\mu} \prod_{j=1}^n (q^{-l_j})_{\lambda_j} \prod_{j=1}^{n-1} (q^{-m_j})_{\mu_j}}{(q^{1-l-m}/y)_{\lambda+\mu} \prod_{j=1}^n (q)_{\lambda_j} \prod_{j=1}^{n-1} (q)_{\mu_j}} \right. \\
\times q^{\sum_{j=1}^n \lambda_j (1+k_j + \sum_{a=1}^{j-1} (k_a - (l_a + m_a)) + \sum_{j=1}^{n-1} \mu_j (1+\sum_{a=1}^j (k_a - (l_a + m_a)) + m_j)} \right] \\
= z^{k_0} \frac{(y)_k}{(yz)_k} \sum_{\kappa \in \mathbb{N}^{n+1}} \left[ \frac{(z)_{\kappa} \prod_{j=0}^n (q^{-k_j})_{\kappa_j}}{(q^{1-k}/y)_{\kappa} \prod_{j=0}^n (q)_{\kappa_j}} (q^{1+k_0-k}/(yz))^{\kappa_0} q^{\sum_{j=1}^n \kappa_j (1+k_j - \sum_{a=j}^n (k_a - (l_a + m_a)))} \right], \quad (3)$$

where we adopt the same labelling convention  $\kappa = (\kappa_0, \kappa_1, \dots, \kappa_n)$  for components of  $\kappa$  as per k. We also use the shorthand  $\kappa = \sum_{j=0}^{n} \kappa_j$ ,  $\lambda = \sum_{j=1}^{n} \lambda_j$  and  $\mu = \sum_{j=1}^{n-1} \mu_j$ , as well as the convention  $m_n = 0$  wherever it appears.

We will not give the proof of proposition 1 yet, however, we can immediately note that both sides are finite sums in light of the  $(q^{-a})_{\alpha}$  terms in the numerators which vanish for  $\alpha > a$ . We choose to write infinite sums to make explicit the connection with q-Lauricella series. To do so succintly, we define two auxilliary n-tuples of integers  $\mathbf{r} = (r_j)$  and  $\mathbf{p} = (p_j)$  by

$$r_j = 1 + \sum_{a=1}^{j} (k_a - (l_a + m_a)), \qquad p_j = 1 - \sum_{a=j}^{n} (k_a - (l_a + m_a)),$$
 (4)

for j = 1, ..., n (taking  $m_n = 0$  as before). Let us also denote by  $\hat{r}$  the (n-1)-tuple  $(r_1, ..., r_{n-1})$ , and by  $\tilde{k}$  the (n-1)-tuple  $(k_1, ..., k_n)$  for convenience.

Now introduce the type D, q-Lauricella series treated in [1]

$$\Phi_D^{(n)}[\beta; \alpha_1, \dots, \alpha_n; \gamma; q; x_1, \dots, x_n] = \sum_{\nu_1 = 0}^{\infty} \dots \sum_{\nu_n = 0}^{\infty} \frac{(\beta)_{\nu} (\alpha_1)_{\nu_1} \dots (\alpha_n)_{\nu_n}}{(\gamma)_{\nu} (q)_{\nu_1} \dots (q)_{\nu_n}} x_1^{\nu_1} \dots x_n^{\nu_n},$$
 (5)

where as before we use the notation  $\nu = \sum_{j=1}^{n} \nu_j$ . Using (4), and (5), the equality (3) is written succinctly as  $\Theta_{k,l,m} = \Omega_{k,l,m}$ , where

$$\Theta_{k,l,m} = \frac{(y)_{l+m}}{(yz)_{l+m}} \Phi_D^{(2n-1)} \left[ z; q^{-l}, q^{-m}; q^{1-l-m}/y; q; q^{r+l+(m,0)}, q^{\hat{r}+m} \right], \tag{6}$$

is the left hand side, and

$$\Omega_{k,l,m} = z^{k_0} \frac{(y)_k}{(yz)_k} \Phi_D^{(n+1)} \left[ z; q^{-k}; q^{1-k}/y; q; q^{1+k_0-k}/(yz), q^{p+\tilde{k}} \right], \tag{7}$$

is the right hand side. Here we are using element-wise exponentian short hand  $q^{x} = (q^{x_1}, \dots q^{x_m})$ .

A standard proceedure for dealing with expressions such as (6) and (7) may be to use (4.1) from [1] to rewrite them in terms of  $_{m+1}\phi_m$  basic hypergeometric functions (See [2] (1.2.22)) and work with known transformation forumlae thereof. This approach is not valid here. For example, applying (4.1) [1] to (6) yields

$$\Theta_{k,l,m} \propto {}_{2n}\phi_{2n-1} \begin{bmatrix} q^{1-l-m}/(yz), q^{r+l+(m,0)}, q^{\hat{r}+m} \\ q^{r_1+m_1}, \dots, q^{r_{n-1}+m_{n-1}}, q^{r_n}, q^{r_1}, \dots, q^{r_{n-1}}; q, z \end{bmatrix},$$
(8)

which contains denominator arguments of the form  $q^a$  with a potentially a negative integer. In this case the  $m+1\phi_m$  function is undefined and a similar problem occurs with the RHS (7).

Fortunately we do not need the transformation rule (4.1) from [1]; we can settle for the intermediate step

$$\Phi_D^{(n)}[\beta; \boldsymbol{\alpha}; \gamma; q; \boldsymbol{x}] = \frac{(\beta)_{\infty}}{(\gamma)_{\infty}} \sum_{a=0}^{\infty} \frac{(\gamma/\beta)_a}{(q)_a} \beta^a \prod_{j=1}^n \left( \sum_{\nu_j=1}^{\infty} \frac{(\alpha_j)_{\nu_j}}{(q)_{\nu_j}} (x_j q^a)^{\nu_j} \right). \tag{9}$$

In [1] the bracketed sums are evaluated using the infinite summation identity for  $_1\phi_0[\alpha;q,x]$  (II.3) [2], however, in our case these sums are terminating since  $\alpha_j$  is always a negative integer power of q. We therefore apply the finite summation identity (II.4) [2]

$${}_{1}\phi_{0}[q^{-m};q,x] = \sum_{n=0}^{\infty} \frac{(q^{-m})_{n}}{(q)_{n}} x^{n} = (xq^{-m})_{m}.$$

$$(10)$$

Combining formulae (9) and (10) we obtain

$$\Theta_{k,l,m} = \frac{(y)_{l+m}}{(yz)_{l+m}} \frac{(z)_{\infty}}{(q^{1-l-m}/y)_{\infty}} \sum_{\lambda=0}^{\infty} \frac{(q^{1-l-m}/(yz))_{\lambda}}{(q)_{\lambda}} (q^{r_n+\lambda})_{l_n} z^{\lambda} \prod_{j=1}^{n-1} (q^{r_j+m_j+\lambda})_{l_j} (q^{r_j+\lambda})_{m_j} 
= \frac{(z)_{\infty}}{(q/y)_{\infty}} \frac{(y)_{l+m}}{(yz)_{l+m}} \left( \frac{(q^{1-l-m}/(yz))_{l+m}}{(q^{1-l-m}/y)_{l+m}} z^{l+m} \right) \sum_{\lambda=0}^{\infty} \frac{(q/(yz))_{\lambda-l-m}}{(q)_{\lambda}} \left( \prod_{j=1}^{n} (q^{r_j+\lambda})_{l_j+m_j} \right) z^{\lambda-l-m} 
= \frac{(z)_{\infty}}{(q/y)_{\infty}} \sum_{\lambda=0}^{\infty} \frac{(q/(yz))_{\lambda-l-m}}{(q)_{\lambda}} \left( \prod_{j=1}^{n} (q^{r_j+\lambda})_{l_j+m_j} \right) z^{\lambda-l-m}, \tag{11}$$

for the LHS, where again we understand  $m_n = 0$ , and

$$\Omega_{\mathbf{k},\mathbf{l},\mathbf{m}} = z^{k_0} \frac{(y)_k}{(yz)_k} \frac{(z)_\infty}{(q^{1-k}/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q^{1-k}/(yz))_\kappa}{(q)_\kappa} (q^{1+\kappa-k}/(yz))_{k_0} \left( \prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^{\kappa} \\
= \left( z^{k_0} \frac{(yq^{k-k_0})_{k_0}}{(yzq^{k-k_0})_{k_0}} \frac{(q^{1-k}/(yz))_{k_0}}{(q^{1-k}/(y))_{k_0}} \right) \frac{(y)_{k-k_0}}{(yz)_{k-k_0}} \frac{(z)_\infty}{(q^{1-(k-k_0)}/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q^{1-(k-k_0)}/(yz))_\kappa}{(q)_\kappa} \left( \prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^{\kappa} \\
= \frac{(y)_{k-k_0}}{(yz)_{k-k_0}} \left( \frac{(q^{1-(k-k_0)}/(yz))_{k-k_0}}{(q^{1-(k-k_0)}/(y))_{k-k_0}} z^{k-k_0} \right) \frac{(z)_\infty}{(q/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q/(yz))_{\kappa-(k-k_0)}}{(q)_\kappa} \left( \prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^{\kappa-(k-k_0)} \\
= \frac{(z)_\infty}{(q/y)_\infty} \sum_{\kappa=0}^{\infty} \frac{(q/(yz))_{\kappa-(k-k_0)}}{(q)_\kappa} \left( \prod_{j=1}^n (q^{p_j+\kappa})_{k_j} \right) z^{\kappa-(k-k_0)}, \tag{12}$$

for the RHS. It follows from these expressions that both  $\Theta_{k,l,m}$  and  $\Omega_{k,l,m}$  are independent of  $k_0$ , and depend on  $l_i$  and  $m_i$ , only in the combinations  $l_i+m_i$  (both of these facts are necessary for (3) to hold). By cancelling the prefactors in (11) and (12), and relabelling  $l_i+m_i\mapsto l_i$  for  $i=1,\ldots,n-1,\ k-k_0\mapsto k=\sum_{j=1}^n k_j$  and  $q/(yz)\mapsto y$ , to better reflect the dependence, we have reduced the equality  $\Theta_{k,l,m}=\Omega_{k,l,m}$  to the following.

**Proposition 2.** For any integer  $n \geq 1$ , complex parameter q, such that 0 < |q| < 1, arbitrary complex parameters y and z, and non-negative integer tuples  $\mathbf{l} = (l_j) \in \mathbb{Z}_{\geq 0}^n$  and  $\mathbf{k} = (k_j) \in \mathbb{Z}_{\geq 0}^n$  (j = 1, ..., n), we have the following equality

$$\sum_{\lambda=0}^{\infty} \frac{(y)_{\lambda-l}}{(q)_{\lambda}} (q^{r_1+\lambda})_{l_1} \dots (q^{r_n+\lambda})_{l_n} z^{\lambda-l} = \sum_{\kappa=0}^{\infty} \frac{(y)_{\kappa-k}}{(q)_{\kappa}} (q^{p_1+\kappa})_{k_1} \dots (q^{p_n+\kappa})_{k_n} z^{\kappa-k}, \tag{13}$$

where  $k = \sum_{j=1}^{n} k_j$ ,  $l = \sum_{j=1}^{n} l_j$ , and  $p_j$  and  $r_j$  are as per (4) (with  $(l_a + m_a) \mapsto l_a$ ).

The proof of proposition 2 requires two technical lemmas.

**Lemma 1.** With k, l, k, l, and  $p_j$  as per proposition 2, suppose that  $k \ge l$  and define  $\Delta = k - l \ge 0$ . Then for any integer  $0 \le \kappa \le \Delta - 1$  we have

$$(q^{p_1+\kappa})_{k_1}\dots(q^{p_n+\kappa})_{k_n} = 0. (14)$$

*Proof.* It suffices to show that for any  $0 \le \kappa \le \Delta - 1$ , there exists j such that  $p_j + \kappa \le 0$  and  $p_j + \kappa + k_j > 0$ , that is,  $\{0, 1, \ldots, \Delta - 1\} \subset U$  where  $U = \bigcup_{j=1}^n (-(p_j + k_j), -p_j]$ . Since  $-(p_j + k_j) = -(p_{j+1} + l_j) \le -p_{j+1}$  (for  $j = 1, \ldots, n-1$ ), it follows that U is an overlapping union of intervals giving

$$U = \left( \min_{j=1}^{n} (-(p_j + k_j)), \max_{j=1}^{n} (-p_j) \right] := (m, p].$$

Now note that  $p \ge -p_1 = \Delta - 1$  and  $m \le -(p_n + k_n) = -(1 + l_n) < 0$  so we are done.

**Lemma 2.** With k, l, k, l, and  $r_j$  as per proposition 2, suppose that  $k \ge l$  and define  $\Delta = k - l \ge 0$ . Then for any integer  $\lambda \ge 0$  we have

$$(q^{r_1+\lambda})_{k_2}\dots(q^{r_{n-1}+\lambda})_{k_n} = 0, \quad \Leftrightarrow \quad (q^{r_1+\lambda})_{l_1}\dots(q^{r_{n-1}+\lambda})_{l_{n-1}} = 0, \quad \Leftrightarrow \quad \lambda \le r := \max_{j=1}^{n-1}(-r_j). \tag{15}$$

Furthermore, for any integer  $\lambda > r$  we have

$$\frac{(q^{1+\lambda})_{k_1}(q^{r_1+\lambda})_{k_2}\dots(q^{r_{n-1}+\lambda})_{k_n}}{(q^{r_1+\lambda})_{l_1}\dots(q^{r_n+\lambda})_{l_n}} = \frac{(q)_{\lambda+\Delta}}{(q)_{\lambda}}.$$
(16)

Proof. For the first claim define  $K_0 = \{\lambda \in \mathbb{Z}_{\geq 0} \mid (q^{r_1+\lambda})_{k_2} \dots (q^{r_{n-1}+\lambda})_{k_n} = 0\}$  and similarly define  $L_0 = \{\lambda \in \mathbb{Z}_{\geq 0} \mid (q^{r_1+\lambda})_{l_1} \dots (q^{r_{n-1}+\lambda})_{l_{n-1}} = 0\}$ . Clearly  $\lambda \in K_0$ , if and only if there is some  $1 \leq j \leq n-1$  such that  $k_{j+1} > -(r_j + \lambda) \geq 0$ , giving  $L_0 = \left(\bigcup_{j=1}^{n-1} (-(r_j + k_{j+1}), -r_j]\right) \cap Z_{\geq 0}$ . Similarly, one can find that  $L_0 = \left(\bigcup_{j=1}^{n-1} (-(r_j + l_j), -r_j]\right) \cap Z_{\geq 0}$ . These unions of intervals are overlapping since  $-(r_j + k_{j+1}) = -(r_{j+1} + l_{j+1}) \leq -r_{j+1}$  and  $-(r_j + l_j) = -(r_{j-1} + k_j) \leq -r_{j-1}$ , for  $j = 1, \dots, n-2$  and  $j = 2, \dots, n-1$  respectively, therefore

$$\bigcup_{j=1}^{n-1} (-(r_j + k_{j+1}), -r_j] = \begin{pmatrix} \min_{j=1}^{n-1} (-(r_j + k_{j+1})), \max_{j=1}^{n-1} (-r_j) \\ \bigcup_{j=1}^{n-1} (-(r_j + l_j), -r_j] = \begin{pmatrix} \min_{j=1}^{n-1} (-(r_j + l_j)), \max_{j=1}^{n-1} (-r_j) \\ j=1 \end{pmatrix} := (m_1, r],$$

Now the fact that  $m_1 \le -(r_{n-1} + k_n) = -(1 + \Delta + l_n) < 0$ , and  $m_2 \le -(r_1 + l_1) = -(1 + k_1) < 0$ , gives  $K_0 = \{0, 1, \dots, r\} = L_0$ , which proves the first claim.

For the second claim, we now know that  $\lambda > r$  means that  $\frac{(q^{r_j+\lambda})_{k_{j+1}}}{(q^{r_j+\lambda})_{l_j}} = (q^{r_j+l_j+\lambda})_{k_{j+1}-l_j}$  is non-zero and non-singular. Therefore, the LHS of (16) becomes

$$(q^{1+\lambda})_{k_1} (q^{r_1+l_1+\lambda})_{k_2-l_1} \dots (q^{r_{n-1}+l_{n-1}+\lambda})_{k_n-l_{n-1}} \left[ (q^{1+\Delta+\lambda})_{l_n} \right]^{-1}$$

$$= (q^{1+\lambda})_{k_1+k_2-l_1} (q^{r_2+l_2+\lambda})_{k_3-l_2} \dots (q^{r_{n-1}+l_{n-1}+\lambda})_{k_n-l_{n-1}} \left[ (q^{1+\Delta+\lambda})_{l_n} \right]^{-1}$$

$$\vdots$$

$$= (q^{1+\lambda})_{\Delta+l_n} \left[ (q^{1+\Delta+\lambda})_{l_n} \right]^{-1} = (q^{1+\lambda})_{\Delta} = (q)_{\Delta+\lambda} \left[ (q)_{\lambda} \right]^{-1},$$

as desired, where we iterate the rule  $r_j + l_j = 1 + k_1 + \sum_{a=1}^{j-1} (k_{a+1} - l_a)$  to collapse the product.

Now we can prove proposition 2 and hence proposition 1.

Proof of Proposition 2. Since  $(k_j, l_j) \mapsto (l_{n+1-j}, k_{n+1-j})$  is a symmetry of (13) we can assume WLOG that  $k \geq l$  and define  $\Delta = k - l \geq 0$ . By lemma 1 we can shift the summation of the RHS of (13) to  $\kappa \mapsto \lambda + \Delta$  with  $\lambda \geq 0$ . Making use of the relations  $p_{j+1} + \Delta = r_j$  for  $j = 1, \ldots, n-1$ , and  $p_1 = 1 - \Delta$ , we have

$$\sum_{\kappa=0}^{\infty} \frac{(y)_{\kappa-k}}{(q)_{\kappa}} (q^{p_1+\kappa})_{k_1} \dots (q^{p_n+\kappa})_{k_n} z^{\kappa-k} = \sum_{\lambda=0}^{\infty} \frac{(y)_{\lambda-l}}{(q)_{\lambda+\Delta}} (q^{1+\lambda})_{k_1} (q^{\rho_1+\lambda})_{k_2} \dots (q^{\rho_{n-1}+\lambda})_{k_n} z^{\lambda-l}$$

$$= \sum_{\lambda=0}^{\infty} \frac{(y)_{\lambda-l}}{(q)_{\lambda}} (q^{r_1+\lambda})_{l_1} \dots (q^{r_n+\lambda})_{l_n} z^{\lambda-l}, \tag{17}$$

where the last equality follows from lemma 2.
